Monografía

Methanogens are prokaryotic microorganisms that produce methane as an end-product of a complex biochemical pathway. They are strictly anaerobic archaea and occupy a wide variety of anoxic environments. Methanogens also thrive in the cytoplasm of anaerobic unicellular eukaryotes and in the gastrointestinal tracts of animals and humans. The symbiotic methanogens in the gastrointestinal tracts of ruminants and other g2smethanogenic3s mammals contribute significantly to the global methane budget; especially the rumen hosts an impressive diversity of methanogens. This monograph deals with methanogenic endosymbionts of anaerobic protists, in particular ciliates and termite flagellates, and with methanogens in the gastrointestinal tracts of vertebrates and arthropods. Further reviews discuss the genomic consequences of living together in symbiotic associations, the role of methanogens in syntrophic degradation, and the function and evolution of hydrogenosomes, hydrogen-producing organelles of certain anaerobic protists

Título: (Endo)symbiotic Methanogenic Archaea [Recurso electrónico] edited by Johannes HP Hackstein

Editorial: New York [etc.] Springer

Descripción física: XIV, 238 p. 57 il., 9 il. en color

Mención de serie: Microbiology Monographs 1862-5576 19

Detalles del sistema: Modo de acceso: world wide web Modo de acceso: World Wide Web

Fuente de adquisición directa: Springer (e-Books)

ISBN: 9783642136153 978-3-642-13615-3 9783642136146

Autores: Hackstein, Johannes H.P

Punto acceso adicional serie-Título: Microbiology Monographs 1862-5576 19
